Explanation writing is a text **that explains something**. Once you have completed your science experiments, write a step by step guide to explain how you completed them. Remember to include steps, a clear description and you can even explain how and why they work!

Reflect on how the instructions you followed were written!

Did they need to be clearer? Did they forget a step?

Make sure to put the steps in your own words - don't copy directly from the experiment.

(think back to when we wrote step by step instructions to make a sandwich)

Share this writing to me by sending me a photo or an email! I would be very excited to read all your pieces. If you like you can choose a different science experiment to write about, but you have to have completed it first :)
